IDENTITY / POSITIONING

Software Development Engineer in Test / QA Automation Engineer focused on API automation, test framework improvement, CI/CD-integrated quality, environment-aware debugging, and practical automation that improves delivery confidence.

SHORT RECRUITER SUMMARY

SDET / QA Automation Engineer with 7+ years of experience across API and UI automation, CI/CD quality workflows, test framework improvement, regression reliability, and DevOps-aligned quality engineering. Strong fit for roles that need an engineer who can improve automation coverage, strengthen framework feedback, integrate tests into delivery pipelines, and work closely with developers across the full software delivery cycle.

Yauheni's strongest hands-on match for XM is REST API testing, framework improvement, CI/CD pipelines, Docker/Kubernetes support context, Grafana/log-based troubleshooting, Git, agile collaboration, and practical scripting in Python/PowerShell/JavaScript. He is comfortable translating business and product requirements into technical test coverage, defining formal test procedures and test plans, managing issues through investigation and resolution, and sharing practical QA expertise with the team. Python is positioned honestly as a practical automation and scripting capability supported by broader engineering experience, while his recent deepest day-to-day stack has been Playwright/TypeScript, PowerShell, C#, REST API testing, and Azure DevOps.

CORE STRENGTHS

- API automation and backend-quality validation
- Test automation framework improvement
- Functional and regression test coverage expansion
- CI/CD-integrated automation execution
- Test plans, test procedures, and traceable coverage
- Business requirements to technical test requirements
- Performance-testing strategy awareness
- Automation signal quality and failure triage
- Issue investigation and resolution ownership
- Python scripting and framework-support capability
- Git-based collaboration and review workflows
- Docker / Kubernetes support context
- Grafana, logs, and observability-assisted debugging
- Agile SDLC / STLC collaboration with developers
- Knowledge sharing and QA team enablement
- Practical process optimization and ownership

MAIN STACK

- REST API testing
- Python scripting
- Playwright
- TypeScript / JavaScript
- Selenium WebDriver
- C#
- PowerShell
- Postman / Newman
- Git
- Jenkins
- Azure DevOps
- YAML pipelines
- Docker
- Kubernetes
- Grafana
- SQL
- TestRail

ADDITIONAL TOOLS / TECHNOLOGIES

Functional automation testing | Regression testing | Test framework design | Test libraries and automation utilities | Test plans / test procedures | Internal product design documentation analysis | External certification requirements awareness | Performance testing awareness | WebSocket testing awareness | Kafka / event-driven systems awareness | AWS adaptability | Mobile automation exposure | Emulators and environment tooling | Windows / Linux | Bash | Azure | Bicep | TeamCity | Prometheus / Loki | Power Automate | FlaUI | AI-assisted QA workflows

EXPERIENCE

EPAM Systems — Automation QA Engineer / Tester (.NET)

Minsk, Belarus 09/2017 – 11/2018

EPAM was the starting school that built the classic foundation in enterprise automation and coding-based testing.

Focus areas:

- Java and C# automation foundations
- Selenium WebDriver
- NUnit
- Some mobile automation through Xamarin
- Regression coverage in enterprise environments

Value of this period:

- Built classic testing and coding foundation
- Gained early enterprise automation discipline
- Learned to work with code-based automation in structured environments

Leapwork — Tester / DevOps Engineer

Minsk, Belarus / Kraków, Poland 11/2018 – 03/2025

This was the longest and most formative stage of the career. Although part of the time was formally structured through outsourcing partners, in practice it was one long product journey around the same product, product teams, and ecosystem.

Initially the work was closer to QA and automation around a no-code automation product, but over time it expanded naturally into scripting, environment automation, infrastructure support, release-related work, and full DevOps-oriented responsibilities.

Key themes of this period:

- Built PowerShell, JavaScript, and utility automation to remove repetitive manual workflows and improve team efficiency.
- Worked across product quality, installation flows, environment setup, release support, logs, and pipeline-driven delivery.
- Created internal helper scripts, browser-side automations, VM utilities, and installation automation for repeatable engineering workflows.
- Used practical scripting and systems knowledge to support complex automation scenarios beyond black-box test execution.
- Helped teams troubleshoot issues by connecting QA evidence, environment state, logs, and delivery pipeline behavior.

DevOps / Infrastructure scope:

- Azure infrastructure automation
- Bicep and YAML pipelines
- PowerShell-driven environment automation
- Azure DevOps pipelines and release support
- Virtual machines, Key Vault, Application Gateway, WAF, firewall, monitoring, logs, and workbooks
- Environment creation, update automation, and internal team workflow improvements

Docker / Kubernetes / observability positioning:

- Real hands-on experience supporting existing infrastructure and automation environments.
- Worked with containers, logs, services, practical debugging, and deployment issues.
- Used Grafana, K9s, Helm, and Kubernetes in support / maintenance contexts.

Collaboration / knowledge sharing:

- Often acted as a broad technical-context person connecting QA, product, infrastructure, and process details.
- Helped others understand systems and workflows, supported onboarding, and shared practical troubleshooting knowledge.
- Strong technical ownership instincts without positioning as formal people manager.

Additional domain/context notes:

- Worked extensively around enterprise application workflows, especially Dynamics 365.
- Some exposure to Salesforce-related scenarios.
- Solid experience with green-screen style applications in banking-related contexts.

Definely — QA Automation Engineer

Kraków, Poland 06/2025 – 03/2026

At Definely, the focus returned more strongly to framework improvement, test automation strategy, and quality support in a complex product environment.

Key contributions:

- Improved and extended an existing API automation framework for broader team use.
- Increased test coverage from around 117 to 199 tests without increasing runtime.
- Reduced log volume from around 1.5 GB to 11 MB per run by removing unnecessary debug logging.
- Made test output much more useful for analysis, triage, and developer collaboration.
- Strengthened API/backend validation signal and made failures easier for QA and developers to investigate.
- Improved test setup efficiency by moving repeated UI preconditions to API-based setup where appropriate.

Automation transition story:

- Initially worked with an API framework and existing UI automation approaches.
- Team later moved from FlaUI to Power Automate for UI automation because business constraints required manual QA engineers to contribute to automation quickly.
- Built a hybrid model where no-code orchestration was supported by PowerShell and Python for gaps and limitations.
- Later the product shifted from the old C#-based COM direction to Office.js (OJS).
- At that point, Playwright with TypeScript became the most practical and maintainable automation direction.

What this period demonstrates:

- Ability to improve and optimize existing frameworks.
- Ability to move between different automation approaches depending on business need.
- Enabling manual QA engineers and building an automation baseline for wider team use.
- Pragmatic engineering judgment rather than technology ideology.
- Experience with modern AI-assisted tooling such as Cloud Code, ChatGPT, Copilot, and agent-based workflow experiments.
- Practical fit for API-heavy SDET roles requiring framework maintenance, coverage extension, and clean CI feedback.

Reason for transition / current search direction:

- Company priorities shifted more toward development and maintaining existing end-to-end tests, rather than actively expanding automation further.
- Looking for a role with more room to grow as an automation-focused engineer and continue building systems, not only maintaining them.
