Yauheni Sheima

IDENTITY / POSITIONING

Automation Test Engineer / Senior QA Automation Engineer focused on maintainable UI/API automation, CI/CD-integrated quality gates, release confidence, and practical testing of complex enterprise workflows.

SHORT RECRUITER SUMMARY

Automation Test Engineer with 7+ years of experience across UI/API automation, manual testing, backend-oriented validation, and CI/CD-integrated quality workflows. Strong fit for payments-platform roles that need reliable automated coverage, lower regression effort, clear defect evidence, and confidence across critical processing journeys.

Yauheni has a Java/Selenium automation foundation from enterprise QA work and recent hands-on strengths in Playwright, TypeScript/JavaScript, C#, REST API framework improvement, Jenkins/Azure DevOps-style pipelines, SQL/database context, logs/debugging, and environment-aware quality work. He is comfortable validating end-to-end flows across UI, API, backend, logs, database queries, and Unix/Linux environments, which fits payments automation where traceability, controls, data correctness, quality gates, and release readiness matter.

LONG PROFESSIONAL NARRATIVE

I started as a QA Automation Engineer and over time moved deeper into DevOps and infrastructure automation. For me, that was not a radical switch but a natural continuation of the same core interest: automation.

I am strongly driven by optimization. If I see a repetitive manual process, I almost automatically start thinking about how to reduce it, connect it with another tool, automate it, or remove it completely. That mindset applies both to work and outside work. I enjoy understanding how systems work, removing routine, building useful internal tools, and making team workflows easier and faster.

Today, my profile sits at the intersection of QA Automation, DevOps-aligned delivery, infrastructure and environment automation, internal tooling, and process improvement. My strongest side is not theory for the sake of theory, but practical engineering and automation: identifying bottlenecks, building solutions from available tools, and improving the way work gets done.

CORE STRENGTHS

- Automation-first QA mindset with pragmatic manual coverage
- Maintainable UI/API automation and regression coverage
- Java/Selenium automation foundation and Playwright experience
- API/service-level validation and framework improvement
- BDD / Cucumber / specification-by-example aligned test thinking
- Log analysis, database-query investigation, and Unix/Linux troubleshooting
- CI/CD-integrated test execution, reporting, and release confidence
- Test data, traceability, and defect-evidence mindset
- Collaboration with Product Owners, Developers, BAs, and Ops
- Enterprise workflow and payments-domain adaptability
- Banking-style and regulatory workflow context
- End-to-end flow and edge-case validation mindset
- Automation coverage documentation and metrics awareness
- Practical framework improvement and test signal optimization
- Issue analysis, tracking, and root-cause-oriented debugging

MAIN STACK

Selenium WebDriver | Playwright | Java automation foundations | REST API testing | Postman / Newman | SQL / database queries | Unix / Linux | Logs analysis | BDD / Gherkin / SpecFlow | Jenkins | Git | CI/CD pipelines | C# | TypeScript / JavaScript | PowerShell | Azure DevOps | TestRail | TeamCity

ADDITIONAL TOOLS / TECHNOLOGIES

Manual testing | Test plans / test cases | Regression testing | Functional and non-functional testing | Backend testing | Integration-layer testing | Contract/schema validation awareness | JUnit / TestNG ecosystem familiarity | Maven / Gradle ecosystem familiarity | REST Assured / SoapUI awareness | JMeter awareness | Python scripting basics | Payment flows / processing lifecycle adaptability | Credit transfers / direct debits awareness | Payment gateways, validation, routing, and posting awareness | Returns, recalls, reversals, rejects, repairs, and exception-handling awareness | Cut-off times, value dates, fees, limits, and sanctions/AML touchpoint awareness | SWIFT / ISO 20022 awareness | Test data strategy and transaction correlation mindset | Quality gates / execution reporting | Automation coverage dashboards and metrics | Splunk / ELK-style observability awareness | Docker | Kubernetes | Bash | Agile / Scrum | Issue tracking | Enterprise workflow testing | Azure | Bicep | Helm | Grafana | Prometheus / Loki | Key Vault | Application Gateway | WAF | Virtual Machines | Windows / Linux | Power Automate | FlaUI

EXPERIENCE

EPAM Systems — Automation QA Engineer / Tester (.NET)

Minsk, Belarus
09/2017 – 11/2018

EPAM was the starting school that built the classic foundation in enterprise automation and coding-based testing.

Focus areas:

- Java and C# automation foundations
- Selenium WebDriver
- NUnit
- Some mobile automation through Xamarin
- Regression coverage in enterprise environments
- Manual and automated validation in structured enterprise delivery

Value of this period:

- Built classic testing and coding foundation
- Gained early enterprise automation discipline
- Learned to work with code-based automation in structured environments
- Built a Selenium foundation relevant to automation-first QA roles
- Built Java automation grounding relevant to Java-based testing ecosystems

Leapwork — Tester / DevOps Engineer

Minsk, Belarus / Kraków, Poland
11/2018 – 03/2025

This was the longest and most formative stage of the career. Although part of the time was formally structured through outsourcing partners, in practice it was one long product journey around the same product, product teams, and ecosystem.

Initially the work was closer to QA and automation around a no-code automation product, but over time it expanded naturally into scripting, environment automation, infrastructure support, release-related work, and full DevOps-oriented responsibilities.

Key themes of this period:

- Worked in a no-code automation environment, but consistently gravitated toward more technical and engineering-heavy work
- Built PowerShell scripts, JavaScript and Tampermonkey automations, helper tools, VM utilities, installation automation, and many workflow improvements for self and team
- Automated repetitive manual flows and removed unnecessary manual steps wherever possible
- Transitioned naturally from local VM and scripting work into broader Azure and infrastructure automation
- Worked with complex enterprise workflows where issue investigation often required looking beyond the UI into environments, logs, services, and data/state conditions
- Developed strong release-confidence instincts: reliable automation, environment stability, diagnostics, and clear evidence for defects

Examples of automation mindset in practice:

- Silent installation flows for the product
- Remote installation on multiple machines
- Browser extensions for pipeline-related work
- JavaScript scripts and shortcuts for repetitive actions
- Internal helper tools to avoid repeated manual work

DevOps / Infrastructure scope:

- Azure infrastructure automation
- Bicep and YAML pipelines
- PowerShell-driven environment automation
- Azure DevOps pipelines and release support
- Virtual machines, Key Vault, Application Gateway, WAF, firewall, monitoring, logs, workbooks
- Environment creation and update automation
- Internal team workflow improvements
- Practical Unix/Linux, container, and service-debugging context for backend-facing QA work

Docker / Kubernetes positioning:

- Real hands-on experience supporting existing infrastructure
- Worked with containers, logs, services, practical debugging and deployment issues
- Used Grafana, K9s, Helm, and Kubernetes in support / maintenance mode
- Should be positioned honestly as practical hands-on usage, not enterprise-level platform architecture ownership from scratch

Leadership / collaboration angle:

- Often acted as a “Swiss army knife” engineer with broad product and technical context

- Helped others understand systems and workflows
- Mentoring and onboarding experience
- Strong technical ownership instincts without positioning as formal people manager

Additional domain/context notes:

- Worked extensively around enterprise application workflows, especially Dynamics 365
- Some exposure to Salesforce-related scenarios
- Solid experience with green-screen style applications in banking-related contexts
- Useful fit for payments and banking-adjacent environments where transaction flows, traceability, controls, and careful validation matter

Definely — QA Automation Engineer

Kraków, Poland
06/2025 – 03/2026

At Definely, the focus returned more strongly to framework improvement, test automation strategy, and quality support in a complex product environment.

Key contributions:

- Improved and extended an existing API automation framework
- Increased test coverage from around 117 to 199 tests without increasing runtime
- Reduced log volume from around 1.5 GB to 11 MB per run by removing unnecessary debug logging
- Made test output much more useful for analysis and triage
- Strengthened API/backend validation signal and made failures easier for developers and QA to investigate
- Demonstrated maintainability and flakiness-reduction mindset by improving signal quality rather than only increasing test count

Automation transition story:

- Initially worked with an API framework and existing UI automation approaches
- Team later moved from FlaUI to Power Automate for UI automation because business constraints required manual QA engineers to contribute to automation quickly
- Built a hybrid model where no-code orchestration was supported by PowerShell and Python for gaps and limitations
- Later the product shifted from the old C#-based COM direction to Office.js (OJS)
- At that point, Playwright with TypeScript became the most practical and maintainable automation direction

What this period demonstrates:

- Ability to improve and optimize existing frameworks
- Ability to move between different automation approaches depending on business need
- Enabling manual QA engineers and building automation baseline for wider team use
- Pragmatic engineering judgment rather than technology ideology
- Experience with modern AI-assisted tooling such as Cloud Code, ChatGPT, Copilot, and agent-based workflow experiments
- Practical balance of manual testing, automation, framework work, and team enablement
- Strong fit for teams building meaningful automated coverage around real business flows and release controls

Reason for transition / current search direction:

- Company priorities shifted more toward development and maintaining existing end-to-end tests, rather than actively expanding automation further
- Looking for a role with more room to grow as an automation-focused engineer and continue building systems, not only maintaining them
