

Yauheni Sheima

IDENTITY / POSITIONING

Automation Test Engineer / QA Automation Engineer focused on infrastructure-aware testing, REST API integrations, workflow validation, CI/CD-aware quality, and practical debugging across automation platforms.

SHORT RECRUITER SUMMARY

Automation Test Engineer with 7+ years of experience across QA automation, REST API testing, infrastructure-aware quality workflows, CI/CD, scripting, and environment diagnostics. Strong fit for roles requiring validation of automation workflows, service request outcomes, REST integrations, workflow dependencies, error handling, structured test documentation, and collaboration with automation engineers, developers, and DevOps teams.

Yauheni has strong practical experience with PowerShell, JavaScript/TypeScript, REST API testing, Azure/Azure DevOps, YAML pipelines, logs, Linux/Windows environments, Docker/Kubernetes support context, and workflow automation. VMware Aria Orchestrator / Service Broker would be a ramp-up area, but the core work pattern matches his background: understand an automation process, validate execution paths, analyze failures, document defects clearly, and improve quality standards.

LONG PROFESSIONAL NARRATIVE

I started as a QA Automation Engineer and over time moved deeper into DevOps and infrastructure automation. For me, that was not a radical switch but a natural continuation of the same core interest: automation.

I am strongly driven by optimization. If I see a repetitive manual process, I almost automatically start thinking about how to reduce it, connect it with another tool, automate it, or remove it completely. That mindset applies both to work and outside work. I enjoy understanding how systems work, removing routine, building useful internal tools, and making team workflows easier and faster.

Today, my profile sits at the intersection of QA Automation, DevOps-aligned delivery, infrastructure and environment automation, internal tooling, and process improvement. My strongest side is not theory for the sake of theory, but practical engineering and automation: identifying bottlenecks, building solutions from available tools, and improving the way work gets done.

CORE STRENGTHS

Infrastructure-aware QA automation and workflow validation

REST API integration testing

JavaScript / TypeScript and PowerShell scripting context

Linux logs review, diagnostics, and command-line work

JSON structures and parameter validation mindset

CI/CD concepts, Git basics, and pipeline-driven quality

Structured test cases, test plans, checklists, and defect documentation

Workflow dependencies, conditions, inputs/outputs, and error handling

Collaboration with automation engineers, developers, and DevOps teams

Enterprise infrastructure and integration-platform adaptability

Troubleshooting mindset across services, logs, APIs, and environments

Continuous improvement of testing processes and automation quality

MAIN STACK

ADDITIONAL TOOLS / TECHNOLOGIES

EXPERIENCE

EPAM Systems — Automation QA Engineer / Tester (.NET)

Minsk, Belarus

09/2017 – 11/2018

EPAM was the starting school that built the classic foundation in enterprise automation and coding-based testing.

Focus areas:

- Java and C# automation foundations
- Selenium WebDriver
- NUnit
- Some mobile automation through Xamarin
- Regression coverage in enterprise environments

Value of this period:

- Built classic testing and coding foundation
- Gained early enterprise automation discipline
- Learned to work with code-based automation in structured environments

Leapwork — Tester / DevOps Engineer

Minsk, Belarus / Kraków, Poland

11/2018 – 03/2025

This was the longest and most formative stage of the career. Although part of the time was formally structured through outsourcing partners, in practice it was one long product journey around the same product, product teams, and ecosystem.

Initially the work was closer to QA and automation around a no-code automation product, but over time it expanded naturally into scripting, environment automation, infrastructure support, release-related work, and full DevOps-oriented responsibilities.

Key themes of this period:

- Worked in a no-code automation environment, but consistently gravitated toward more technical and engineering-heavy work
- Built PowerShell scripts, JavaScript and Tampermonkey automations, helper tools, VM utilities, installation automation, and many workflow improvements for self and team
- Automated repetitive manual flows and removed unnecessary manual steps wherever possible
- Transitioned naturally from local VM and scripting work into broader Azure and infrastructure automation
- Validated and supported automation workflows where correctness depended on inputs, execution paths, environment state, logs, and service behavior

Examples of automation mindset in practice:

- Silent installation flows for the product
- Remote installation on multiple machines
- Browser extensions for pipeline-related work
- JavaScript scripts and shortcuts for repetitive actions
- Internal helper tools to avoid repeated manual work
- Workflow helpers and scripts built around real team processes and repeated operational tasks

DevOps / Infrastructure scope:

- Azure infrastructure automation
- Bicep and YAML pipelines
- PowerShell-driven environment automation
- Azure DevOps pipelines and release support
- Virtual machines, Key Vault, Application Gateway, WAF, firewall, monitoring, logs, workbooks
- Environment creation and update automation
- Internal team workflow improvements
- Practical troubleshooting of infrastructure automation, environments, logs, and integrations

Docker / Kubernetes positioning:

- Real hands-on experience supporting existing infrastructure
- Worked with containers, logs, services, practical debugging and deployment issues
- Used Grafana, K9s, Helm, and Kubernetes in support / maintenance mode
- Should be positioned honestly as practical hands-on usage, not enterprise-level platform architecture ownership from scratch

Leadership / collaboration angle:

- Often acted as a “Swiss army knife” engineer with broad product and technical context
- Helped others understand systems and workflows
- Mentoring and onboarding experience
- Strong technical ownership instincts without positioning as formal people manager

Additional domain/context notes:

- Worked extensively around enterprise application workflows, especially Dynamics 365
- Some exposure to Salesforce-related scenarios
- Solid experience with green-screen style applications in banking-related contexts

Definely — QA Automation Engineer

Kraków, Poland

06/2025 – 03/2026

At Definely, the focus returned more strongly to framework improvement, test automation strategy, and quality support in a complex product environment.

Key contributions:

- Improved and extended an existing API automation framework
- Increased test coverage from around 117 to 199 tests without increasing runtime
- Reduced log volume from around 1.5 GB to 11 MB per run by removing unnecessary debug logging
- Made test output much more useful for analysis and triage
- Strengthened API/integration validation signal and made failures easier to investigate

Automation transition story:

- Initially worked with an API framework and existing UI automation approaches
- Team later moved from FlaUI to Power Automate for UI automation because business constraints required manual QA engineers to contribute to automation quickly
- Built a hybrid model where no-code orchestration was supported by PowerShell and Python for gaps and limitations
- Later the product shifted from the old C#-based COM direction to Office.js (OJS)
- At that point, Playwright with TypeScript became the most practical and maintainable automation direction

What this period demonstrates:

- Ability to improve and optimize existing frameworks
- Ability to move between different automation approaches depending on business need
- Enabling manual QA engineers and building automation baseline for wider team use
- Pragmatic engineering judgment rather than technology ideology
- Experience with modern AI-assisted tooling such as Cloud Code, ChatGPT, Copilot, and agent-based workflow experiments

Reason for transition / current search direction:

- Company priorities shifted more toward development and maintaining existing end-to-end tests, rather than actively expanding automation further
- Looking for a role with more room to grow as an automation-focused engineer and continue building systems, not only maintaining them
