IDENTITY / POSITIONING

Senior QA Automation Engineer / SDET focused on Playwright-based UI/API automation, E2E coverage, CI/CD-integrated testing, framework improvement, and practical technical leadership in Scrum teams.

SHORT RECRUITER SUMMARY

Senior QA Automation Engineer with 7+ years of experience across UI/API automation, E2E testing, CI/CD quality workflows, framework improvement, and DevOps-aligned QA. Strong fit for Intellias' Digital Eco System context: Playwright, TypeScript/JavaScript, API testing, test data thinking, CI/CD automation, Scrum collaboration, AI-assisted workflows, and continuous improvement of tooling and processes.

Yauheni is strongest in roles where automation is treated as an engineering discipline: building maintainable test coverage, improving framework reliability, debugging failures, reporting test results clearly, and helping teams adopt better practices. His leadership fit is technical: mentoring, onboarding, explaining systems, improving workflows, and taking ownership of quality decisions without over-positioning as a formal people manager.

CORE STRENGTHS

- 7+ years in QA automation and quality engineering
- Playwright automation and TypeScript / JavaScript
- UI and API automation for web applications
- E2E test coverage and regression strategy
- Test automation framework improvement and maintenance
- CI/CD-integrated automated test execution
- Test data management mindset for API/E2E scenarios
- AI-assisted automation workflow experience
- Scrum collaboration with developers and product teams
- Technical mentoring, onboarding, and team enablement
- Debugging, test reporting, and failure analysis
- Shift-left and continuous-improvement mindset

MAIN STACK

- Playwright
- TypeScript / JavaScript
- REST API testing
- Postman / Newman
- CI/CD pipelines
- Azure DevOps
- Jenkins
- GitHub Actions-style workflows
- SQL
- C#
- PowerShell
- TestRail
- TeamCity

ADDITIONAL TOOLS / TECHNOLOGIES

- E2E automation
- UI test automation frameworks
- API test automation frameworks
- Test runners ecosystem awareness
- Mocha / Jest ecosystem awareness
- Test reports and automation diagnostics
- AI-assisted engineering tools
- Docker
- Kubernetes
- Azure
- Cloud services awareness
- Monitoring/reporting tool awareness
- SQL / NoSQL test data setup awareness
- Bash
- Windows / Linux
- Agile / Scrum
- Power Automate
- FlaUI

EXPERIENCE

EPAM Systems — Automation QA Engineer / Tester (.NET)

Minsk, Belarus

09/2017 – 11/2018

EPAM was the starting school that built the classic foundation in enterprise automation and coding-based testing.

Focus areas:

- Java and C# automation foundations
- Selenium WebDriver
- NUnit
- Some mobile automation through Xamarin
- Regression coverage in enterprise environments

Value of this period:

- Built classic testing and coding foundation
- Gained early enterprise automation discipline
- Learned to work with code-based automation in structured environments
- Built the base for maintainable UI automation and regression testing

Leapwork — Tester / DevOps Engineer

Minsk, Belarus / Kraków, Poland

11/2018 – 03/2025

This was the longest and most formative stage of the career. Although part of the time was formally structured through outsourcing partners, in practice it was one long product journey around the same product, product teams, and ecosystem.

Initially the work was closer to QA and automation around a no-code automation product, but over time it expanded naturally into scripting, environment automation, infrastructure support, release-related work, and full DevOps-oriented responsibilities.

Key themes of this period:

- Worked in a no-code automation environment, but consistently gravitated toward more technical and engineering-heavy work
- Built PowerShell scripts, JavaScript and Tampermonkey automations, helper tools, VM utilities, installation automation, and many workflow improvements for self and team
- Automated repetitive manual flows and removed unnecessary manual steps wherever possible
- Transitioned naturally from local VM and scripting work into broader Azure and infrastructure automation
- Supported complex enterprise workflows where quality depended on automation, environments, delivery pipelines, and product context

DevOps / Infrastructure scope:

- Azure infrastructure automation
- Bicep and YAML pipelines
- PowerShell-driven environment automation
- Azure DevOps pipelines and release support
- Virtual machines, Key Vault, Application Gateway, WAF, firewall, monitoring, logs, workbooks
- Environment creation and update automation
- Internal team workflow improvements

Leadership / collaboration angle:

- Often acted as a broad technical-context person who could connect product, QA, infrastructure, and process details

- Helped others understand systems and workflows
- Mentoring and onboarding experience
- Strong technical ownership instincts without positioning as formal people manager

Definely — QA Automation Engineer

Kraków, Poland

06/2025 – 03/2026

At Definely, the focus returned more strongly to framework improvement, test automation strategy, and quality support in a complex product environment.

Key contributions:

- Improved and extended an existing API automation framework
- Increased test coverage from around 117 to 199 tests without increasing runtime
- Reduced log volume from around 1.5 GB to 11 MB per run by removing unnecessary debug logging
- Made test output much more useful for analysis and triage
- Strengthened API/backend validation signal and made failures easier for developers and QA to investigate

Automation transition story:

- Initially worked with an API framework and existing UI automation approaches
- Team later moved from FlaUI to Power Automate for UI automation because business constraints required manual QA engineers to contribute to automation quickly
- Built a hybrid model where no-code orchestration was supported by PowerShell and Python for gaps and limitations
- Later the product shifted from the old C#-based COM direction to Office.js (OJS)
- At that point, Playwright with TypeScript became the most practical and maintainable automation direction

What this period demonstrates:

- Ability to improve and optimize existing frameworks
- Ability to move between different automation approaches depending on business need
- Enabling manual QA engineers and building automation baseline for wider team use
- Pragmatic engineering judgment rather than technology ideology
- Experience with modern AI-assisted tooling such as Cloud Code, ChatGPT, Copilot, and agent-based workflow experiments
- Practical balance of manual testing, automation, framework work, and team enablement
