IDENTITY / POSITIONING

Senior QA Engineer / Test Automation Engineer focused on UI/API automation, framework improvement, CI/CD-integrated test execution, SQL-backed validation, and practical quality ownership in agile product teams.

SHORT RECRUITER SUMMARY

Senior QA Engineer with 7+ years of experience across test automation, manual and automated testing, API/backend validation, SQL-based checks, CI/CD quality workflows, and framework improvement. Strong fit for Omada's Senior Test Automation Engineer role where quality depends on reliable automated feedback, close developer collaboration, and continuous improvement of automation around a security-focused product.

Yauheni's strongest fit for Omada is C#/.NET automation foundation, Selenium experience, API and integration testing, SQL validation, Azure DevOps pipeline context, code-based troubleshooting, test planning, and practical Playwright/TypeScript automation direction. IAM and cybersecurity are positioned as a motivated product-domain fit, not as overstated prior domain specialization.

CORE STRENGTHS

MAIN STACK

ADDITIONAL TOOLS / TECHNOLOGIES

EXPERIENCE

EPAM Systems - Automation QA Engineer / Tester (.NET)

Minsk, Belarus

09/2017 - 11/2018

EPAM built the classic enterprise automation base: code-based testing, regression discipline, and collaboration in structured delivery environments.

Focus areas:

- Java and C# automation foundations
- Selenium WebDriver automation
- NUnit-based test execution
- Regression coverage in enterprise environments
- Some mobile automation through Xamarin

Value of this period for Omada:

- Built the C#/.NET and Selenium foundation relevant to Omada's automation stack
- Learned to work with code-based automation in structured engineering teams
- Developed early discipline around regression testing, defect feedback, and automation maintainability

Leapwork - Tester / DevOps Engineer

Minsk, Belarus / Krakow, Poland

11/2018 - 03/2025

This was the longest and most formative product stage, combining QA, automation enablement, infrastructure support, and workflow improvement around a complex automation platform.

Key themes of this period:

- Worked in a no-code automation product environment while consistently taking on technical automation and tooling work
- Built PowerShell scripts, JavaScript and Tampermonkey automations, helper tools, VM utilities, installation automation, and workflow improvements
- Automated repetitive manual flows and reduced unnecessary manual effort for self and team
- Supported complex product workflows where quality depended on automation, environment stability, logs, and team process

DevOps / CI/CD scope:

- Azure infrastructure automation
- Bicep and YAML pipeline work
- PowerShell-driven environment automation
- Azure DevOps pipelines and release support
- Virtual machines, monitoring, logs, workbooks, firewalls, and environment troubleshooting

Docker / Kubernetes positioning:

- Hands-on support experience with existing containerized infrastructure
- Worked with containers, logs, services, practical debugging, and deployment issues
- Used Grafana, K9s, Helm, and Kubernetes in support / maintenance mode

Collaboration / ownership angle:

- Often acted as a broad technical-context person connecting product, QA, infrastructure, and process details
- Helped others understand systems and workflows
- Mentoring and onboarding experience
- Strong technical ownership instincts without positioning as formal people manager

Definely - QA Automation Engineer

Krakow, Poland

06/2025 - 03/2026

At Definely, the focus returned more strongly to automation framework improvement, backend/API validation, and quality support in a complex product environment.

Key contributions:

- Improved and extended an existing API automation framework
- Increased test coverage from around 117 to 199 tests without increasing runtime
- Reduced log volume from around 1.5 GB to 11 MB per run by removing unnecessary debug logging
- Made test output much more useful for analysis and triage
- Strengthened API/backend validation signal and made failures easier for developers and QA to investigate

Automation transition story:

- Worked with an API framework and existing UI automation approaches
- Supported a move from FlaUI to Power Automate where business constraints required manual QA engineers to contribute to automation quickly
- Built a hybrid model where no-code orchestration was supported by PowerShell and Python for gaps and limitations
- Later, as the product direction moved toward Office.js, Playwright with TypeScript became the practical maintainable automation direction

What this period demonstrates:

- Ability to improve and optimize existing frameworks
- API and integration-style validation mindset
- Practical SQL/log/test-output analysis for faster defect triage
- Ability to move between automation approaches depending on business need
- Pragmatic engineering judgment rather than technology ideology
- Experience with modern AI-assisted tooling such as Cloud Code, ChatGPT, Copilot, and agent-based workflow experiments
