IDENTITY / POSITIONING

QA Automation Engineer / SDET focused on CI/CD-integrated quality, automation frameworks, evaluation-style testing, observability-informed analysis, and practical process optimization.

SHORT RECRUITER SUMMARY

QA Automation Engineer with 7+ years of experience across UI/API automation, CI/CD, framework improvement, and DevOps-aligned quality engineering. Strong in Azure DevOps, PowerShell, Playwright, Selenium, REST API testing, SQL/PostgreSQL context, and pipeline-driven delivery. Particularly effective in building automated checks, improving feedback quality, reducing noisy test output, and turning failures into clear root-cause signals for engineering teams.

ROLE-FIT SUMMARY FOR CIKLUM

This role needs a quality engineer who can own evaluation workflows, create repeatable acceptance baselines, automate regression checks in CI/CD, and explain quality metrics clearly to technical stakeholders. My strongest fit is in practical automation: improving test frameworks, integrating checks into pipelines, using logs and metrics to guide triage, and building structured feedback loops that help teams make safer release decisions.

I have not owned a production RAGAS implementation end to end, so I would not present myself as a long-time LLM evaluation specialist. The honest fit is a QA automation / evaluation engineer who can ramp quickly into RAGAS, DeepEval-style workflows, and LLM quality measurement because the underlying work pattern is familiar: define expected behavior, build datasets and baselines, automate repeatable checks, monitor regressions, classify failures, and make the results actionable for engineering.

CORE STRENGTHS

QA automation across UI, API, framework, and delivery workflows CI/CD-integrated quality gates and regression feedback
Azure DevOps pipelines and YAML-based delivery automation
Test framework improvement and maintainability work Error analysis, triage, and practical root-cause classification
Reducing noisy logs and improving signal quality in test output
Metrics-minded quality reporting and release confidence Python and PowerShell scripting for automation gaps and tooling
SQL / PostgreSQL context for test data and backend validation
Observability-adjacent work with Grafana, logs, monitoring, and dashboards
Cross-functional collaboration with QA, developers, DevOps, and product stakeholders

MAIN STACK

Azure DevOps YAML pipelines PowerShell Python TypeScript / JavaScript Playwright Selenium
REST API testing SQL / PostgreSQL C# TestRail Jenkins
TeamCity

ADDITIONAL TOOLS / TECHNOLOGIES

Azure Bicep Docker Kubernetes Helm Grafana Prometheus / Loki Azure monitoring / workbooks
Postman / Newman FlaUI Power Automate Git Windows / Linux

EXPERIENCE

EPAM Systems — Automation QA Engineer / Tester (.NET)

Minsk, Belarus

09/2017 – 11/2018

EPAM built the classic foundation in enterprise automation, regression testing, and code-based QA practices.

Focus areas:

- Java and C# automation foundations
- Selenium WebDriver and NUnit-based test automation
- Regression coverage in enterprise environments
- Early experience with structured QA processes and team delivery

Relevant value for Ciklum:

- Built baseline discipline in repeatable automated testing and defect-focused analysis
- Learned to convert expected behavior into executable checks and regression coverage
- Developed a practical foundation for test design, debugging, and cross-team communication

Leapwork — Tester / DevOps Engineer

Minsk, Belarus / Kraków, Poland

11/2018 – 03/2025

This was the longest and most formative stage of my career. Although part of the period was formally structured through outsourcing partners, in practice it was one long product journey around the same product, teams, and ecosystem.

The role started closer to QA and automation around a no-code automation platform, then expanded into scripting, environment automation, infrastructure support, Azure DevOps, release support, and internal tooling.

Quality and automation scope:

- Worked close to automation-product behavior, regression flows, installation scenarios, and environment reliability
- Built scripts, helper tools, VM utilities, browser extensions, and workflow automations to reduce repeated manual work
- Supported delivery and release workflows where quality feedback needed to be visible, repeatable, and actionable
- Helped teams reason through failures across product behavior, environments, infrastructure, and pipelines

DevOps / CI/CD scope:

- Azure DevOps pipelines and YAML pipeline maintenance
- PowerShell-driven environment automation and installation flows
- Azure infrastructure automation with Bicep and practical platform support
- Work with virtual machines, Key Vault, Application Gateway, WAF, firewall rules, logs, monitoring, and workbooks
- Practical Docker/Kubernetes support through logs, services, deployments, Helm, K9s, and Grafana

Relevant value for Ciklum:

- Strong match for automated regression guardrails in Azure DevOps

- Comfortable turning quality criteria into pipeline checks and repeatable automation
- Used logs, dashboards, and telemetry-like evidence to narrow down failures instead of relying on vague test results
- Strong at building small tools and scripts around existing systems without requiring a full platform redesign

Definely — QA Automation Engineer

Kraków, Poland

06/2025 – Present

At Definely, the focus returned more strongly to framework improvement, API automation, test strategy, and quality support in a complex product environment.

Key contributions:

- Improved and extended an existing API automation framework
- Increased API automation coverage from around 117 to 199 tests without increasing runtime
- Reduced log volume from around 1.5 GB to 11 MB per run by removing unnecessary debug logging
- Made test output easier to analyze by improving the signal-to-noise ratio in automation results
- Worked with PostgreSQL context on the latest project and used backend data understanding to support test validation and investigation

Automation transition story:

- Worked with existing API and UI automation approaches, then adapted automation strategy as product and business needs changed
- Supported a hybrid model where no-code orchestration was backed by PowerShell and Python scripts for gaps and limitations
- As the product shifted toward Office.js, Playwright with TypeScript became the more practical and maintainable automation direction
- Used modern AI-assisted tools such as ChatGPT, Copilot, Claude Code, and agent-style workflows to speed up engineering and investigation tasks

Relevant value for Ciklum:

- Direct experience improving a test framework without adding unnecessary runtime cost
- Strong fit for maintaining baseline metrics and detecting regressions from measurable changes
- Practical experience reducing automation noise, which maps well to evaluation reports and hallucination/error tracking
- Comfortable classifying failures, separating real product issues from test/infrastructure noise, and making results usable for developers

TARGETED MATCH TO CIKLUM REQUIREMENTS

Evaluation lifecycle / golden dataset:

Experienced in defining repeatable acceptance checks, extending test coverage, and building automation around expected behavior. For this role, I would transfer that discipline to golden-query sets, baseline metrics, and recurring evaluation runs.

RAGAS / LLM evaluation harness:

RAGAS itself would be a ramp-up area, but the underlying engineering is familiar: Python-supported automation, structured test suites, metric collection, result comparison, and CI/CD integration.

CI/CD regression guardrails:

Strong practical fit through Azure DevOps, YAML pipelines, release support, and pipeline-integrated quality checks.

Hallucination root-cause taxonomy:

Strong adjacent fit through defect triage, log analysis, framework debugging, and separating product, data, environment, and automation causes. The LLM/code-generation taxonomy would be a new domain, but the failure-analysis method is familiar.

Performance / latency benchmarking:

Adjacent experience through CI feedback, runtime optimization, logs, Grafana/monitoring context, and keeping automation growth from increasing execution time.

EDUCATION

Belarusian State University of Informatics and Radioelectronics (BSUIR)

Bachelor of Science in Digital Economy

Minsk, Belarus

2013 - 2017
