IDENTITY / POSITIONING

Senior QA Automation Engineer / SDET focused on mobile and API test automation, CI/CD-integrated quality, and practical test ownership for large-scale consumer platforms. Strong background in functional testing, test framework design, and cross-functional quality collaboration.

SHORT RECRUITER SUMMARY

Senior QA Automation Engineer with 7+ years of experience in functional testing, QA automation, and mobile testing across web and API layers. Strong in Playwright, Selenium, Postman, CI/CD pipelines (Jenkins, Azure DevOps, TeamCity), and test framework design. Solid Java automation foundation with hands-on understanding of mobile platforms (iOS/Android), client-server architecture, and network protocols. Experienced in agile ceremonies, shift-left testing, production root cause analysis, and mentoring QA team members. Native Russian speaker with professional English for international team collaboration. Based in Kraków, Poland (CET).

LONG PROFESSIONAL NARRATIVE

I started as a QA Automation Engineer and over the years built deep experience across functional testing, test automation, mobile testing, and CI/CD-integrated quality workflows. My career has been driven by one core interest: making quality systematic, measurable, and fast.

I am strongly driven by proactive quality ownership. I don't just execute test cases — I look for ways to improve testing processes, build frameworks that scale, integrate quality into delivery pipelines early, and help teams ship with confidence. I enjoy understanding how systems work end-to-end, from mobile clients through APIs to backend services, and using that understanding to find defects that others miss.

Today, my profile combines strong functional testing skills with hands-on automation across UI, API, and mobile layers. I have experience designing test cases and test suites for complex product features, building and maintaining automated test frameworks, integrating them into CI/CD pipelines, and collaborating closely with developers and product managers in agile environments. I am comfortable investigating production issues, performing root cause analysis, and advocating for product testability.

CORE STRENGTHS

Senior QA ownership: test case/suite design, functional testing, and automation

Mobile testing understanding: iOS and Android platforms, emulators, client-server architecture

API testing and automation (Postman, REST API frameworks)

Test framework design, development, and CI/CD integration

Shift-left testing practices and quality advocacy in agile teams

Production issue investigation and root cause analysis

Cross-functional collaboration with product managers and engineering teams

Mentoring QA team members and enabling manual QA engineers to contribute to automation

AI-assisted development tools for faster test design, debugging, and code review

Strong automation mindset and systems thinking

Pragmatic engineering decisions based on business constraints

Native Russian language proficiency

MAIN STACK

ADDITIONAL TOOLS / TECHNOLOGIES

EXPERIENCE

EPAM Systems — Automation QA Engineer / Tester (.NET)

Minsk, Belarus

09/2017 – 11/2018

EPAM was the starting school that built the classic foundation in enterprise automation, functional testing, and mobile testing.

Focus areas:

- Java and C# automation foundations
- Selenium WebDriver for web UI automation
- NUnit test framework
- Mobile automation through Xamarin (iOS and Android)
- Functional testing and regression coverage in enterprise environments
- Test case design and test suite maintenance

Value of this period:

- Built classic testing and coding foundation with Java and C#
- Gained early mobile automation experience (Xamarin for iOS/Android)
- Learned structured functional testing: test case design, execution, and reporting
- Developed understanding of client-server architecture in enterprise applications
- Gained early enterprise automation discipline in agile team environments

Leapwork — Tester / DevOps Engineer

Minsk, Belarus / Kraków, Poland

11/2018 – 03/2025

This was the longest and most formative stage of the career. Worked on a no-code automation platform with responsibilities spanning functional testing, automation, infrastructure support, and quality process improvement.

Key themes of this period:

- Performed functional testing of complex enterprise web applications
- Built PowerShell scripts, JavaScript automations, helper tools, and workflow improvements
- Automated repetitive manual flows and removed unnecessary manual steps

- Supported quality workflows combining manual investigation with automation
- Participated in agile ceremonies: refinement, sprint planning, demos, retrospectives

Testing and quality ownership:

- Designed and maintained test cases and test suites for product features
- Performed API testing and validation using Postman-style tools
- Investigated production issues and performed root cause analysis
- Collaborated with developers to prevent regressions and improve testability
- Mentored QA team members and onboarded new engineers

DevOps / CI/CD scope:

- Azure infrastructure automation with Bicep and YAML pipelines
- PowerShell-driven environment automation
- Azure DevOps pipelines and release support
- Environment creation and update automation
- Monitoring, logs, and observability (Grafana, Prometheus, Loki)

Leadership / collaboration angle:

- Acted as a broad-context engineer with deep product and technical understanding
- Helped stakeholders across technical and non-technical teams understand quality implications
- Mentoring and onboarding experience
- Strong technical ownership without formal people management title

Additional domain/context notes:

- Worked extensively around enterprise application workflows (Dynamics 365, Salesforce scenarios)
- Solid experience with complex multi-step user workflows
- Understanding of network protocols and client-server communication

Definely — QA Automation Engineer

Kraków, Poland
06/2025 – 03/2026

At Definely, the focus returned strongly to test automation strategy, framework improvement, and quality engineering in a complex product environment.

Key contributions:

- Improved and extended an existing API automation framework
- Increased test coverage from around 117 to 199 tests without increasing runtime
- Reduced log volume from around 1.5 GB to 11 MB per run by removing unnecessary debug logging
- Made test output much more useful for analysis and triage
- Integrated automated test suites into CI/CD pipelines for fast feedback

Automation transition story:

- Initially worked with an API framework and existing UI automation approaches
- Team moved from FlaUI to Power Automate for UI automation to enable manual QA engineers
- Built a hybrid model: no-code orchestration supported by PowerShell and Python for gaps
- Later adopted Playwright with TypeScript as the most maintainable automation direction
- Applied AI-assisted tools (Claude Code, ChatGPT, Copilot) to accelerate test design and debugging

What this period demonstrates:

- Ability to design, build, and maintain test frameworks and tools for QA teams
- Ability to integrate automation into CI/CD pipelines effectively
- Enabling manual QA engineers and building automation baseline for wider team use
- Pragmatic engineering judgment: choosing tools based on team needs and business constraints
- Experience with AI-assisted development tools for faster coding, testing, and code review
- Shift-left testing practices and quality advocacy

Reason for transition / current search direction:

- Company priorities shifted more toward maintaining existing tests rather than expanding automation
- Looking for a senior QA Automation role with more room to build systems, drive quality strategy, and grow as an automation-focused engineer
