

Yauheni Sheima

IDENTITY / POSITIONING

QA Automation Engineer / SDET focused on test automation frameworks, scripting-driven quality workflows, documentation discipline, and practical debugging across complex product environments.

SHORT RECRUITER SUMMARY

QA Automation Engineer with 7+ years of experience across test automation, UI/API validation, scripting, CI/CD-integrated quality workflows, framework improvement, and detailed issue investigation. Strong fit for automation roles that require analytical debugging, maintainable test scripts, clear documentation, and close collaboration with developers and QA teams.

Yauheni's recent work includes improving API automation frameworks, making test results easier to analyze, reducing noisy logs, and building practical tooling around quality workflows. While Squish, COCO, and embedded medical-device automation would be ramp-up areas, his background in automation frameworks, scripting, structured test documentation, enterprise product workflows, and careful debugging is relevant to building reliable automated coverage for healthcare solutions.

LONG PROFESSIONAL NARRATIVE

I started as a QA Automation Engineer and over time moved deeper into DevOps and infrastructure automation. For me, that was not a radical switch but a natural continuation of the same core interest: automation.

I am strongly driven by optimization. If I see a repetitive manual process, I almost automatically start thinking about how to reduce it, connect it with another tool, automate it, or remove it completely. That mindset applies both to work and outside work. I enjoy understanding how systems work, removing routine, building useful internal tools, and making team workflows easier and faster.

Today, my profile sits at the intersection of QA Automation, DevOps-aligned delivery, infrastructure and environment automation, internal tooling, and process improvement. My strongest side is not theory for the sake of theory, but practical engineering and automation: identifying bottlenecks, building solutions from available tools, and improving the way work gets done.

CORE STRENGTHS

Test automation framework improvement and maintenance

Scripting mindset for practical automation problems

Analytical debugging and root-cause investigation

Clear test documentation and defect evidence

Software Test Specification / structured test thinking

UI/API automation and regression coverage

CI/CD-integrated quality workflows

Logs, environment, and data/state investigation

Collaboration with developers, QA teams, and stakeholders

Careful validation mindset for healthcare/product-quality contexts

Automation strategy optimization and reliability improvement

Pragmatic ramp-up into new tools and domains

EXPERIENCE

EPAM Systems — Automation QA Engineer / Tester (.NET)

Minsk, Belarus

09/2017 – 11/2018

EPAM was the starting school that built the classic foundation in enterprise automation and coding-based testing.

Focus areas:

- Java and C# automation foundations
- Selenium WebDriver
- NUnit
- Some mobile automation through Xamarin
- Regression coverage in enterprise environments
- Structured enterprise testing and documentation habits

Value of this period:

- Built classic testing and coding foundation
- Gained early enterprise automation discipline
- Learned to work with code-based automation in structured environments
- Built the foundation for maintainable automated test scripts and clear defect reporting

Leapwork — Tester / DevOps Engineer

Minsk, Belarus / Kraków, Poland

11/2018 – 03/2025

This was the longest and most formative stage of the career. Although part of the time was formally structured through outsourcing partners, in practice it was one long product journey around the same product, product teams, and ecosystem.

Initially the work was closer to QA and automation around a no-code automation product, but over time it expanded naturally into scripting, environment automation, infrastructure support, release-related work, and full DevOps-oriented responsibilities.

Key themes of this period:

- Worked in a no-code automation environment, but consistently gravitated toward more technical and engineering-heavy work
- Built PowerShell scripts, JavaScript and Tampermonkey automations, helper tools, VM utilities, installation automation, and many workflow improvements for self and team
- Automated repetitive manual flows and removed unnecessary manual steps wherever possible

- Transitioned naturally from local VM and scripting work into broader Azure and infrastructure automation
- Developed a strong scripting/tooling habit that transfers well to Python/Squish-style automation work

Examples of automation mindset in practice:

- Silent installation flows for the product
- Remote installation on multiple machines
- Browser extensions for pipeline-related work
- JavaScript scripts and shortcuts for repetitive actions
- Internal helper tools to avoid repeated manual work
- Practical troubleshooting across product behavior, environments, logs, and workflow state

DevOps / Infrastructure scope:

- Azure infrastructure automation
- Bicep and YAML pipelines
- PowerShell-driven environment automation
- Azure DevOps pipelines and release support
- Virtual machines, Key Vault, Application Gateway, WAF, firewall, monitoring, logs, workbooks
- Environment creation and update automation
- Internal team workflow improvements

Docker / Kubernetes positioning:

- Real hands-on experience supporting existing infrastructure
- Worked with containers, logs, services, practical debugging and deployment issues
- Used Grafana, K9s, Helm, and Kubernetes in support / maintenance mode
- Should be positioned honestly as practical hands-on usage, not enterprise-level platform architecture ownership from scratch

Leadership / collaboration angle:

- Often acted as a “Swiss army knife” engineer with broad product and technical context
- Helped others understand systems and workflows
- Mentoring and onboarding experience
- Strong technical ownership instincts without positioning as formal people manager

Additional domain/context notes:

- Worked extensively around enterprise application workflows, especially Dynamics 365
- Some exposure to Salesforce-related scenarios
- Solid experience with green-screen style applications in banking-related contexts
- Relevant mindset for regulated/quality-sensitive products where precision, documentation, and safe workflows matter

Definely — QA Automation Engineer

Kraków, Poland
06/2025 – 03/2026

At Definely, the focus returned more strongly to framework improvement, test automation strategy, and quality support in a complex product environment.

Key contributions:

- Improved and extended an existing API automation framework

- Increased test coverage from around 117 to 199 tests without increasing runtime
- Reduced log volume from around 1.5 GB to 11 MB per run by removing unnecessary debug logging
- Made test output much more useful for analysis and triage
- Improved reliability and readability of automation feedback for faster defect analysis

Automation transition story:

- Initially worked with an API framework and existing UI automation approaches
- Team later moved from FlaUI to Power Automate for UI automation because business constraints required manual QA engineers to contribute to automation quickly
- Built a hybrid model where no-code orchestration was supported by PowerShell and Python for gaps and limitations
- Later the product shifted from the old C#-based COM direction to Office.js (OJS)
- At that point, Playwright with TypeScript became the most practical and maintainable automation direction

What this period demonstrates:

- Ability to improve and optimize existing frameworks
- Ability to move between different automation approaches depending on business need
- Enabling manual QA engineers and building automation baseline for wider team use
- Pragmatic engineering judgment rather than technology ideology
- Experience with modern AI-assisted tooling such as Cloud Code, ChatGPT, Copilot, and agent-based workflow experiments
- Ability to ramp into new automation tools when product constraints require a different testing approach

Reason for transition / current search direction:

- Company priorities shifted more toward development and maintaining existing end-to-end tests, rather than actively expanding automation further
- Looking for a role with more room to grow as an automation-focused engineer and continue building systems, not only maintaining them
